Security, Speed, and Accessibility

Collecting reliability data in a plant environment is a key element to a successful operation, but once the data is collected, analysis and asset condition must be applied. Some corporations take advantage of network databases for their plants to ensure security, integrity, and efficiency of data access. With a network database, one or more Data Analysts may have access to asset health data from their office desktop immediately as data is synchronized to the network from a field tester. Installing and maintaining network software requires some level of IT support, which is sometimes hard to come by. To make life easier on the IT personnel and maintenance staff, consider installing the network software as a thin client.

A Thin Client installation is an installation of the MCEGold application on a network server rather than on each local desktop machine. One installation can provide access to valuable data simultaneously to multiple machines at lightning speeds and with increased security. When the software version changes, IT only has to upgrade the server installation and everyone immediately has the latest version. Wow!

For more information on MCEGold Thin Client installation, please contact Tech Support.

You are invited to submit an Electric Motor Testing Tip of your own and receive a free PdMA mug or hat if we publish it! Contact Lou at 813-621-6463 ext. 126 or lou@pdma.com.
